## **DETAILED ACTION**

### ***Response to Amendment***

1. The amendment received on 03/31/03 has been reviewed and considered with the following results:

As to the objection to the drawings, Applicant's revision of the drawings has not overcome the objection. Therefore, the objection to the drawings is still maintained as set forth below.

The prior art rejections to the claims made in the previous Office Action are now withdrawn in view of applicant's amendments. However, applicant's amendments necessitate new ground of rejection as set forth below.

### ***Drawings***

2. The proposed drawing correction filed on 08/19/02 has been disapproved because it is not in the form of a pen-and-ink sketch showing changes in red ink or with the changes otherwise highlighted. See MPEP § 608.02(v).

### ***Claim Rejections - 35 USC § 102***

3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Art Unit: 2816

4. Claims 1-4, 13, 14, 16, 21, 57, and 69 are rejected under 35 U.S.C. 102(b) as being anticipated by Boomgaard (US 4,903,006).

With regard to claim 1, Boomgaard discloses in Figs.1-2 an active electronic isolator (28) between a source stage (14) and a load stage (22), including at least one circuit path (26-48) into which electrical noise is directed away from the source and the load stages, including configuring means for configuring the path to appear as an infinite impedance to the output signal from the source stage (see column 3 through column 4, line 24).

With regard to claims 2-4 and 69, the reference also meets the recited limitations in these claims.

With regard to claim 13, the reference discloses in Figs.1-2 an active electronic isolator (28) between a source stage (14) and a load stage (22), comprising an electrical input (16) comprising at least one source electrical connection connected to the source stage, an electrical output (24) comprising at least one load electrical connection to the load stage, at least one circuit path (26-48) into which electrical noise is directed away from the source and load electrical connections, in which insertion loss of the electronic isolator is inherently dependent upon the direction of signal and noise transmission through the electronic isolator.

With regard to claims 14, 16, 21, and 57, the reference also meets the recited limitations in these claims.

### ***Conclusion***
